

Managing Soil Compaction

Chris Lawrence, USDA-NRCS Cropland Agronomist, 804/287-1680 or chris.lawrence@va.usda.gov

Compaction Core Concepts:

- The principles are *simple*, but putting them into practice is *not*.
- There are *no silver bullets* or miracle cures, but a long-term commitment to *doing many little things can make a huge difference!*

Compaction Management Recommendations

1. PREVENTION

a. Soil factors

- i. Stay off wet ground - **TRUMP CARD**
- ii. Make your soil a stable, living sponge (see back of this page)

b. Equipment factors

- i. Minimize axle tonnage:
 - Under 5 keeps you alive; 5 to 10 – you'll know where you've been; Over 10 – never again!
- ii. Minimize tire-to-soil contact pressure
 - Duals/triples; taller/wider tires; minimize inflation pressures
- iii. Minimize percent of field tracked

2. IDENTIFICATION / DIAGNOSIS

a. DIG and observe crop, soil, and roots

b. Consider field history

c. Use penetrometer

- i. Use it correctly – See Penn State fact sheet
- ii. Remember the confounding factors
 - Rocks/gravel; long-term no-till/perennials; soil moisture

3. ALLEVIATION / REMEDIATION

a. Target your mechanical tillage...

- i. Location – Only the fields and spots that need it
- ii. Spatially – In-row is the way to go!
- iii. Vertically – Just below the “pan”
- iv. Timing – After all traffic & when soil dry enough to shatter
- v. Method – Minimize surface disturbance

b. Maximize your biological tillage...

- i. Make your soil a stable, living sponge (see back of this page)

10 steps for making your soil a living, stable sponge

1. Less (zero) erosion
2. Less (zero) tillage
3. Less (zero) fallow
4. *More residue*
5. *More roots*
6. *More yield*
7. *More diversity*
8. *More perennials*
9. *More cover crops*
10. *More manure*
